2025 Spring Central Sectional Meeting  
March 30, 2025

# Motivating Question

The following sequence (OEIS: A003121)

$$1, 1, 1, 2, 12, 286, 33592, 23178480, \dots$$

is known to count

- shifted standard Young tableaux of staircase shape,
- longest chains in the Tamari lattice,

# Motivating Question

The following sequence (OEIS: A003121)

1, 1, 1, 2, 12, 286, 33592, 23178480, ...

is known to count

- shifted standard Young tableaux of staircase shape,
- longest chains in the Tamari lattice,
- (Davis-Sagan) the normalized volume of a certain pattern-avoiding variant of the Birkhoff polytope

# Motivating Question

The following sequence (OEIS: A003121)

1, 1, 1, 2, 12, 286, 33592, 23178480, ...

is known to count

- shifted standard Young tableaux of staircase shape,
- longest chains in the Tamari lattice,
- (Davis-Sagan) the normalized volume of a certain pattern-avoiding variant of the Birkhoff polytope

## Question(Davis-Sagan)

Is this pattern-avoiding Birkhoff polytope unimodularly equivalent to an order polytope?

# Motivating Question

The following sequence (OEIS: A003121)

1, 1, 1, 2, 12, 286, 33592, 23178480, ...

is known to count

- shifted standard Young tableaux of staircase shape,
- longest chains in the Tamari lattice,
- (Davis-Sagan) the normalized volume of a certain pattern-avoiding variant of the Birkhoff polytope

## Question(Davis-Sagan)

Is this pattern-avoiding Birkhoff polytope unimodularly equivalent to an order polytope?

## Theorem(BCGP)

Yes+

We will work in  $S_{n+1}$  throughout, and we will fix a *Coxeter element*  $c = a_1 \cdots a_n$  (i.e.  $\{a_1, \dots, a_n\} = \{s_1, \dots, s_n\}$ ).

We will work in  $S_{n+1}$  throughout, and we will fix a *Coxeter element*  $c = a_1 \cdots a_n$  (i.e.  $\{a_1, \dots, a_n\} = \{s_1, \dots, s_n\}$ ).

- Let  $c^\infty$  be the infinite word  $a_1 \dots a_n | a_1 \dots a_n | \dots$ .
- Given  $w \in S_{n+1}$ , let  $\text{sort}_c(w)$  be the reduced word of  $w$  which is lexicographically first as a subword of  $c^\infty$ .

We will work in  $S_{n+1}$  throughout, and we will fix a *Coxeter element*  $c = a_1 \cdots a_n$  (i.e.  $\{a_1, \dots, a_n\} = \{s_1, \dots, s_n\}$ ).

- Let  $c^\infty$  be the infinite word  $a_1 \dots a_n | a_1 \dots a_n | \dots$ .
- Given  $w \in S_{n+1}$ , let  $\text{sort}_c(w)$  be the reduced word of  $w$  which is lexicographically first as a subword of  $c^\infty$ .
- **Example:**  $c = s_1 s_3 s_2$ ,  $c^\infty = s_1 s_3 s_2 | s_1 s_3 s_2 | s_1 s_3 s_2 \dots$ .  
If  $w = s_1 s_2 s_1 = s_2 s_1 s_2$ ,  $\text{sort}_c(w) = s_1 s_2 s_1$ .

We will work in  $S_{n+1}$  throughout, and we will fix a *Coxeter element*  $c = a_1 \cdots a_n$  (i.e.  $\{a_1, \dots, a_n\} = \{s_1, \dots, s_n\}$ ).

- Let  $c^\infty$  be the infinite word  $a_1 \dots a_n | a_1 \dots a_n | \dots$ .
- Given  $w \in S_{n+1}$ , let  $\text{sort}_c(w)$  be the reduced word of  $w$  which is lexicographically first as a subword of  $c^\infty$ .
- **Example:**  $c = s_1 s_3 s_2$ ,  $c^\infty = s_1 s_3 s_2 | s_1 s_3 s_2 | s_1 s_3 s_2 \dots$ .  
If  $w = s_1 s_2 s_1 = s_2 s_1 s_2$ ,  $\text{sort}_c(w) = s_1 s_2 s_1$ .

## Definition/Theorem (Hohlweg-Lange-Thomas)

$w \in S_{n+1}$  is a *c-singleton* if and only if  $w$  has a reduced word which is a prefix of a reduced word in the commutation class of  $\text{sort}_c(w_0)$ .

**Example** If  $c = s_1 s_3 s_2$ ,  $\text{sort}_c(w_0) = s_1 s_3 s_2 s_1 s_3 s_2$ , and  $w = s_2 s_1 s_2$  is not a *c-singleton*.

We will work in  $S_{n+1}$  throughout, and we will fix a *Coxeter element*  $c = a_1 \cdots a_n$  (i.e.  $\{a_1, \dots, a_n\} = \{s_1, \dots, s_n\}$ ).

- Let  $c^\infty$  be the infinite word  $a_1 \dots a_n | a_1 \dots a_n | \dots$ .
- Given  $w \in S_{n+1}$ , let  $\text{sort}_c(w)$  be the reduced word of  $w$  which is lexicographically first as a subword of  $c^\infty$ .
- **Example:**  $c = s_1 s_3 s_2$ ,  $c^\infty = s_1 s_3 s_2 | s_1 s_3 s_2 | s_1 s_3 s_2 \dots$ .  
If  $w = s_1 s_2 s_1 = s_2 s_1 s_2$ ,  $\text{sort}_c(w) = s_1 s_2 s_1$ .

## Definition/Theorem (Hohlweg-Lange-Thomas)

$w \in S_{n+1}$  is a *c-singleton* if and only if  $w$  has a reduced word which is a prefix of a reduced word in the commutation class of  $\text{sort}_c(w_0)$ .

*c*-singletons are a subset of *c*-sortable elements, which are the elements of Reading's *c*-Cambrian lattices. The *c*-singletons also form a distributive sublattice of weak order.

# Pattern-avoidance classification

Given  $c$ , for any  $i \in [2, n]$ , let  $i \in \underline{[2, n]}$  if  $s_i$  appears after  $s_{i-1}$  in  $c$  and otherwise  $i \in \overline{[2, n]}$ .

**Example:** Let  $c = s_4 s_2 s_5 s_1 s_3 \in S_6$ . Then,  $\underline{[2, 5]} = \{3, 5\}$  and  $\overline{[2, 5]} = \{2, 4\}$ .

# Pattern-avoidance classification

Given  $c$ , for any  $i \in [2, n]$ , let  $\underline{i} \in [2, n]$  if  $s_i$  appears after  $s_{i-1}$  in  $c$  and otherwise  $\overline{i} \in [2, n]$ .

**Example:** Let  $c = s_4 s_2 s_5 s_1 s_3 \in S_6$ . Then,  $[2, 5] = \{3, 5\}$  and  $\overline{[2, 5]} = \{2, 4\}$ .

Say that  $w$  avoids pattern  $13\underline{2}$  if  $w$  does not contain the pattern  $132$  with “2” lower-barred - that is, we do *not* have  $w = \dots x \dots y \dots z \dots$  with  $x < z < y$  and  $z \in \underline{[2, n]}$ .

# Pattern-avoidance classification

Given  $c$ , for any  $i \in [2, n]$ , let  $\underline{i} \in [2, n]$  if  $s_i$  appears after  $s_{i-1}$  in  $c$  and otherwise  $\overline{i} \in [2, n]$ .

**Example:** Let  $c = s_4 s_2 s_5 s_1 s_3 \in S_6$ . Then,  $[2, 5] = \{3, 5\}$  and  $\overline{[2, 5]} = \{2, 4\}$ .

Say that  $w$  avoids pattern  $13\underline{2}$  if  $w$  does not contain the pattern  $132$  with “2” lower-barred - that is, we do *not* have  $w = \dots x \dots y \dots z \dots$  with  $x < z < y$  and  $z \in \underline{[2, n]}$ .

## Proposition[Reading]

A permutation  $w$  is a  $c$ -singleton if  $w$  avoids  $13\underline{2}$ ,  $31\underline{2}$ ,  $\overline{2}31$ , and  $\overline{2}13$ .

# Pattern-avoidance classification

Given  $c$ , for any  $i \in [2, n]$ , let  $\underline{i} \in [2, n]$  if  $s_i$  appears after  $s_{i-1}$  in  $c$  and otherwise  $\overline{i} \in [2, n]$ .

**Example:** Let  $c = s_4 s_2 s_5 s_1 s_3 \in S_6$ . Then,  $\underline{[2, 5]} = \{3, 5\}$  and  $\overline{[2, 5]} = \{2, 4\}$ .

Say that  $w$  avoids pattern  $13\underline{2}$  if  $w$  does not contain the pattern  $132$  with “2” lower-barred - that is, we do *not* have  $w = \dots x \dots y \dots z \dots$  with  $x < z < y$  and  $z \in \underline{[2, n]}$ .

## Proposition[Reading]

A permutation  $w$  is a  $c$ -singleton if  $w$  avoids  $13\underline{2}$ ,  $31\underline{2}$ ,  $\overline{2}31$ , and  $\overline{2}13$ .

**Example:** If  $c = s_1 s_3 s_2$ ,  $\underline{[2, 3]} = \{2\}$  and  $\overline{[2, 3]} = \{3\}$ . We observe  $4213$  is  $c$ -singleton while  $\mathbf{3241}$  is not.

Given  $w \in S_{n+1}$ , let  $X_w$  be its permutation matrix.  
The *Birkhoff Polytope* is the convex hull of all  $X_w$ .

Given  $w \in S_{n+1}$ , let  $X_w$  be its permutation matrix.  
The *Birkhoff Polytope* is the convex hull of all  $X_w$ .

## Definition

We define  $\text{Birk}(c)$  to be the convex hull of  $\{X_w : w \text{ is a } c\text{-singleton}\}$ .

Given  $w \in S_{n+1}$ , let  $X_w$  be its permutation matrix.  
The *Birkhoff Polytope* is the convex hull of all  $X_w$ .

## Definition

We define  $\text{Birk}(c)$  to be the convex hull of  $\{X_w : w \text{ is a } c\text{-singleton}\}$ .

**Example:** If  $c = s_1 s_3 s_2$ ,  $\text{Birk}(c)$  is the convex hull of the following 9 points in  $\mathbb{R}^{16}$

|                                                                                                  |                                                                                                  |                                                                                                  |                                                                                                  |                                                                                                  |

| $s_1 s_3 s_2 s_1$                                                                                | $s_1 s_3 s_2 s_3$                                                                                | $s_1 s_3 s_2 s_1 s_3$                                                                            | $s_1 s_3 s_2 s_1 s_3 s_2$                                                                        |                                                                                                  |

## Definition

Let  $[u] = u_1 \cdots u_\ell$  be a reduced word. The *heap* from  $[u]$  is the poset on  $\{1, \dots, \ell\}$  which is the transitive closure of relations  $x \prec y$  whenever  $x < y$  and  $u_x$  and  $u_y$  do not commute.

**Example** Given  $w = s_1 s_3 s_2 s_1 s_3 s_2 = u_1 u_2 u_3 u_4 u_5 u_6$ , we draw (1) Hasse diagram of the heap and (2) the same diagram but with  $u_i$  in place of  $i$ .

# Order ideals and linear extensions of a heap

A *linear extension* of a poset is a total order on the set which respects the partial order. For example, there are 4 linear extensions of the poset below.

Proposition [Stembridge]

Linear extensions of a  $\text{Heap}([u])$  are in bijection with the commutation class of  $[u]$ .

# Order ideals and linear extensions of a heap

A *linear extension* of a poset is a total order on the set which respects the partial order. For example, there are 4 linear extensions of the poset below.

## Proposition [Stembridge]

Linear extensions of a  $\text{Heap}([u])$  are in bijection with the commutation class of  $[u]$ .

A *order ideal* of a poset  $(P, \preceq)$  is a set  $I \subseteq P$  such that if  $x \in I$  and  $y \preceq x$ ,  $y \in I$ .

## Rephrasing (Hohlweg-Lange-Thomas)

Order ideals of  $\text{Heap}(\text{sort}_c(w_0))$  are in bijection with  $c$ -singletons.

# Order Polytopes

## Order Polytope [Stanley]

Given a poset  $P$ , the *order polytope* of  $P$ ,  $\mathcal{O}(P)$ , lives in  $\mathbb{R}^P$  and is the convex hull of indicator vectors of the order ideals of  $P$ .

# Order Polytopes

## Order Polytope [Stanley]

Given a poset  $P$ , the *order polytope* of  $P$ ,  $\mathcal{O}(P)$ , lives in  $\mathbb{R}^P$  and is the convex hull of indicator vectors of the order ideals of  $P$ .

### Vertices of $\mathcal{O}(P)$

- ①  $(0, 0, 0, 0, 0, 0)$
- ②  $(1, 0, 0, 0, 0, 0)$
- ③  $(0, 1, 0, 0, 0, 0)$
- ④  $(1, 1, 0, 0, 0, 0)$
- ⑤  $(1, 1, 1, 0, 0, 0)$
- ⑥ etc (4 more)

# Order Polytopes

## Order Polytope [Stanley]

Given a poset  $P$ , the *order polytope* of  $P$ ,  $\mathcal{O}(P)$ , lives in  $\mathbb{R}^P$  and is the convex hull of indicator vectors of the order ideals of  $P$ .

### Vertices of $\mathcal{O}(P)$

- ①  $(0, 0, 0, 0, 0, 0)$
- ②  $(1, 0, 0, 0, 0, 0)$
- ③  $(0, 1, 0, 0, 0, 0)$
- ④  $(1, 1, 0, 0, 0, 0)$
- ⑤  $(1, 1, 1, 0, 0, 0)$
- ⑥ etc (4 more)

## Theorem[Stanley]

The normalized volume of  $\mathcal{O}(P)$  is equal to the number of linear extensions of  $P$ .

# Return to Motivation

Let  $c = s_1 s_2 \cdots s_n$ , so  $\underline{[2, n]} = [2, n]$ ,  $\overline{[2, n]} = \emptyset$ .

- The  $c$ -singletons are 312 and 132 avoiding permutations. There are  $2^n$ .
- The  $c$ -Cambrian lattice is the Tamari lattice.

The heap of  $\text{sort}_c(w_0)$  has the following form:

# Return to Motivation

Let  $c = s_1 s_2 \cdots s_n$ , so  $[2, n] = [2, n]$ ,  $\overline{[2, n]} = \emptyset$ .

- The  $c$ -singletons are 312 and 132 avoiding permutations. There are  $2^n$ .
- The  $c$ -Cambrian lattice is the Tamari lattice.

The following sequences are equal:

- number of shifted standard Young tableaux of staircase shape
- number of longest chains in the Tamari lattice
- normalized volume of  $\text{Birk}(c)$  (Davis-Sagan)

## Question (Davis-Sagan)

For  $c = s_1 s_2 \cdots s_n$ , is  $\text{Birk}(c)$  unimodularly equivalent to an order polytope?

# Main Result: Yes+

## Theorem (BCGP)

*There is a unimodular equivalence between  $\text{Birk}(c)$  and  $\mathcal{O}(\text{Heap}(\text{sort}_c(w_0)))$ .*

When  $c = s_1 s_2 \cdots s_n$ , this answers **yes** to Davis and Sagan's question.

# Main Result: Yes+

## Theorem (BCGP)

*There is a unimodular equivalence between  $\text{Birk}(c)$  and  $\mathcal{O}(\text{Heap}(\text{sort}_c(w_0)))$ .*

When  $c = s_1 s_2 \cdots s_n$ , this answers **yes** to Davis and Sagan's question.

Proof ideas:

- 1 Notice  $\text{Birk}(c)$  is in  $(n+1)^2$ -space while  $\mathcal{O}(\text{Heap}(\text{sort}_c(w_0)))$  is in  $\binom{n+1}{2}$ -space.
- 2 We use Reading's pattern avoidance criteria to describe a projection of  $\text{Birk}(c)$ .

# Main Result: Yes+

## Theorem (BCGP)

*There is a unimodular equivalence between  $\text{Birk}(c)$  and  $\mathcal{O}(\text{Heap}(\text{sort}_c(w_0)))$ .*

When  $c = s_1 s_2 \cdots s_n$ , this answers **yes** to Davis and Sagan's question.

Proof ideas:

- 1 Notice  $\text{Birk}(c)$  is in  $(n+1)^2$ -space while  $\mathcal{O}(\text{Heap}(\text{sort}_c(w_0)))$  is in  $\binom{n+1}{2}$ -space.
- 2 We use Reading's pattern avoidance criteria to describe a projection of  $\text{Birk}(c)$ .
- 3 Then we prove the existence of a unimodular transformation from the projection of  $\text{Birk}(c)$  to  $\mathcal{O}(\text{Heap}(\text{sort}_c(w_0)))$ .

# Zero Relations

To give these projections, we study relations on the affine space spanned by  $\{X_w : w \text{ is a } c\text{-singleton}\}$ :  $\text{aff}(c)$ .

For example, let  $c = [1432657]$ . The following entries are 0 for every point in  $\text{aff}(c)$ .

|  |                 | $\bar{3}$ | $\bar{4}$ |                 | $\bar{6}$ |                 |  |
|--|-----------------|-----------|-----------|-----------------|-----------|-----------------|--|
|  |                 | X         | X         |                 | X         |                 |  |
|  |                 | X         | X         |                 | X         |                 |  |
|  |                 |           | X         |                 |           |                 |  |
|  |                 |           |           |                 |           |                 |  |
|  |                 |           |           |                 |           |                 |  |
|  |                 |           |           | X               |           |                 |  |
|  |                 |           |           | X               |           |                 |  |

# Summing Relations

For every point in  $\text{aff}([1432657])$ , the sum of the entries in like-suited boxes is the same.

| 0                                                                                 | 1                                                                                 | -1                                                                                | -2 | 2                                                                                 | 5                                                                                 | 3                                                                                 | 4                                                                                 |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|

|                                                                                   |                                                                                   |                                                                                   |    |                                                                                   |                                                                                   |                                                                                   |                                                                                   |
|                                                                                   |                                                                                   |                                                                                   |    | X                                                                                 |                                                                                   |                                                                                   |                                                                                   |
|                                                                                   |                                                                                   |                                                                                   |    | X                                                                                 |                                                                                   |                                                                                   |                                                                                   |
|                                                                                   | X                                                                                 |                                                                                   |    | X                                                                                 |                                                                                   | X                                                                                 |                                                                                   |

If  $c = [123 \dots n]$ , then the relations are simpler. The zero relations are:

|  |   |   |   |   |   |   |  |
|--|---|---|---|---|---|---|--|
|  |   |   |   |   |   |   |  |
|  |   |   |   |   |   |   |  |
|  |   |   |   |   |   |   |  |
|  |   |   |   |   |   |   |  |
|  |   |   |   |   |   |   |  |
|  |   |   | X | X |   |   |  |
|  |   | X | X | X | X |   |  |
|  | X | X | X | X | X | X |  |

## Corollary

Given a 132 and 312 avoiding permutation  $w$ , for any  $1 \leq m \leq n+1$ , the values  $w(1), w(2), \dots, w(m)$  are all distinct modulo  $m$ .

(This is equivalent to zero *and* summing relations for  $c = [123 \dots n]$ )

# Future Work

Given any reduced word and heap  $H([u])$ , one can define  $\text{Birk}([u])$  to be the convex hull of permutation matrices arising from linear extensions of  $u$ .

## Question

When is  $\mathcal{O}(H([u]))$  unimodularly equivalent to  $\text{Birk}([u])$ ?

The answer will depend on  $[u]$  and not just the corresponding element of  $S_{n+1}$ . For  $[u] = [2123243212]$ ,  $\text{Birk}([u])$  is 9-dimensional while  $\mathcal{O}(H([u]))$  is 10-dimensional.
